

Sign Language Detection and Classification

Varun Mohan | University of Chicago | MPCS

“

Most of us communicate verbally every single day without truly thinking about it. But what if that wasn't an option?

This is the reality for the deaf community.

People with hearing impairments have no choice but to defer to their other senses, and as a result, there is a gap in communication with those who can hear normally.

10,000,000

People in the U.S. are hard of hearing,

1,000,000

Are functionally deaf,

500,000

Americans use ASL alone.

Bridging the Gap

What can we do help communication with those who rely on ASL?

What is **ASL**?

- ◇ American Sign Language (ASL) is a natural language expressed through hand gestures, allowing communication to be entirely visual rather than audial
- ◇ It is the predominant sign language used by the U.S.'s deaf community

Can We Use Machine Learning to Classify Sign Language?

- ◆ What kind of **data** do we need, and how much of it can we get?
- ◆ What is a reasonable **scope** for a project to answer this question?
- ◆ Assuming a successful model, what would **future** steps look like?

Data

We need image data to train a model

Roboflow: ASL Object Detection Dataset

- ◇ **1728** images in **26** classes for each ASL letter
- ◇ **1512** training set, **144** validation set, and **72** testing
- ◇ Multiple images per class, minor augmentations to brightness and horizontal flip

3

Modeling

Object Detection and CNN Classification

A Two-Step Process

**Hand
Detector**

+

**Neural Network
Classifier**

Hand Detection: MediaPipe

- ◇ **MediaPipe** is a suite of ML models by Google, one of which specializes in hand landmark detection
- ◇ Trained on over 30,000 data points

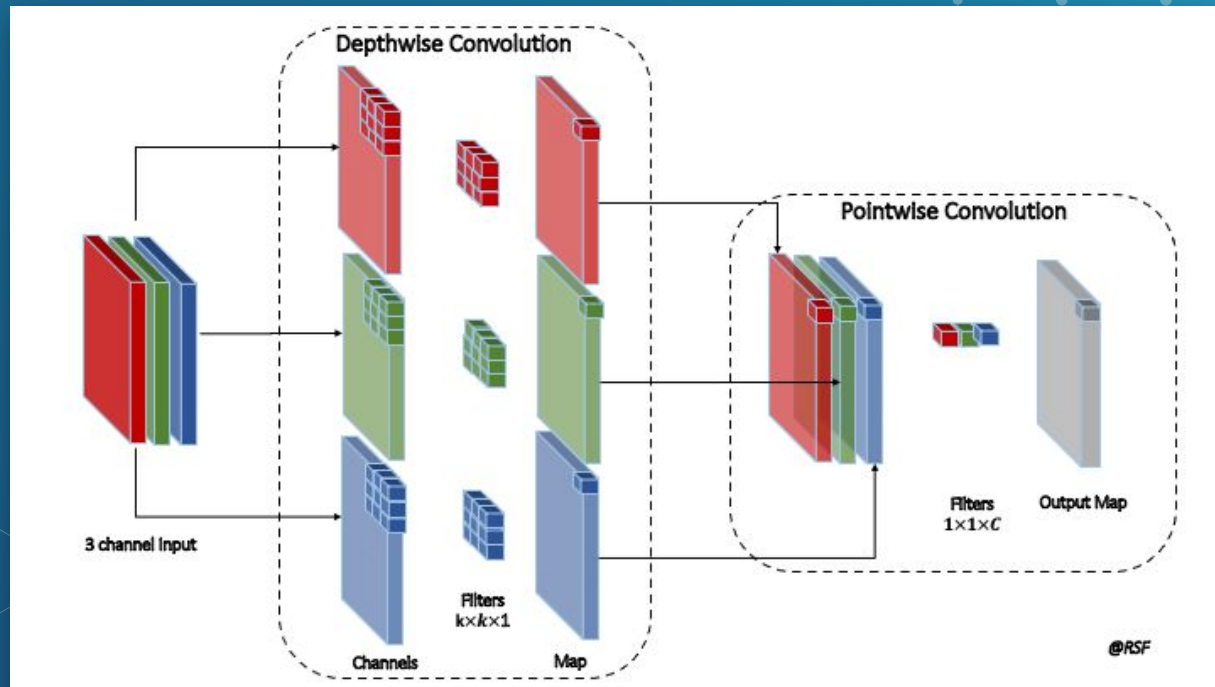

The background of the slide features a repeating pattern of light blue hexagons on a darker blue background. Some hexagons are solid, while others are outlined. A small 3D-style hexagonal icon is positioned to the left of the title.

Classification: MobileNetV2

- ◇ **MobileNet** is a Convolutional Neural Network that specialized for being **lightweight** while maintaining strong predictive accuracy
- ◇ It accomplishes this using **depthwise separable convolutions**

MobileNetV2 Architecture

The background features a dark blue gradient with a pattern of light blue hexagons and dots, resembling a molecular or network structure. A teal hexagon is positioned on the left side, containing the number 4.

4

Results

How did we do?

Accuracy and Precision

	Accuracy	Precision
Train	0.93	0.94
Validation	0.83	0.88
Test	0.75	0.75

Demo

Let's see how it works in real-time!

The background of the slide features a dark blue gradient with a pattern of light blue hexagons and dots, resembling a molecular or network structure. A teal hexagon is positioned on the left side, containing the number 5.

5

Conclusions

Key takeaways and future work

Key Takeaways

Hand Positions Matter

Letters with similar hand positions (i.e. close-fisted) were misclassified more often than more distinctive letters

More Data, Varied Data

Performance was respectably strong on a sparse dataset, but more data + image variation = a better model

What's Next?

Words and Phrases

The future lies in extending models like this into a complete language model for ASL to facilitate true translation.

Real Applications

In any capacity, applications like this can help non-ASL speakers communicate with ASL-speakers, and can be used as learning tools.

THANKS!

ANY QUESTIONS?

The background features a dark blue gradient with a pattern of light blue hexagons and dots, resembling a molecular or network structure. A teal hexagon is positioned to the left of the title.

Appendix

Custom Head Model

```
mobilenet = MobileNetV2(input_shape=IMG_SHAPE, include_top=False, weights='imagenet')

handModel = mobilenet.output
handModel = GlobalAveragePooling2D()(handModel)

handModel = Flatten(name="flatten")(handModel)

handModel = Dense(128, activation="relu")(handModel)
handModel = Dense(256, activation = 'relu')(handModel)
handModel = Dense(512, activation = 'relu')(handModel)

handModel = Dropout(0.5)(handModel)

handModel = Dense(26, activation="softmax")(handModel)
```

Optimization

```
# compile our model
opt = Adam(learning_rate=0.001, weight_decay=0.1)

model.compile(loss="categorical_crossentropy", optimizer=opt,
              metrics=["accuracy", Precision()])

# train the head of the network
history = model.fit(
    aug.flow(train_data, train_labels, batch_size=12), epochs=30,
    validation_data=(val_data, val_labels),
    validation_steps=144/12,
)
```
